Resumen

En el presente proyecto se implementó un sistema para el reconocimiento y permita la extracción de elementos claves en publicaciones científicas.

En el presente proyecto, desarrolla patrones con técnicas del lenguaje natural para la extracción de la información relevante. Mediante la extracción de estos patrones, y la formulación de expresiones regulares que localicen frases claves que se localizan antes y/o después de los elementos claves en las publicaciones científicas.

Los elementos claves son algún modelo, algoritmo o proceso científico, que denotan la aplicación, el objetivo final, el problema, la tarea e identifican los recursos utilizados en el texto de las publicaciones científicas.

Los patrones se identificaron a partir de un corpus que consiste en fragmentos de artículos científicos del área de informática, física y ciencia de los materiales.

El sistema desarrollado en este proyecto podrá mejorarse con la implementación de nuevos enfoques para la extracción de los patrones, agregando nuevos, optimizando los que obtenidos en este proyecto para trabajos posteriores en los que se necesite la identificación y extracción de información relevante que se encuentre en un texto.

1. Introducción

Actualmente existe una gran cantidad de información de forma digital, y cada día se produce más información por lo cual no es posible procesar esta gran cantidad de información manualmente. Afortunadamente se cuenta con herramientas como las computadoras, las cuales tienen una mejor capacidad que los seres humanos para manejar grandes cantidades de información en poco tiempo. Sin embargo, cuando esta información se encuentra en un lenguaje natural como lo es el inglés o el español, las computadoras no pueden procesar esta información como lo hacen los seres humanos, por eso surgen métodos de procesamiento del lenguaje natural y técnicas de extracción de información y a través de estos desarrollar programas que permitan buscar la información de una forma más rápida y en menor tiempo.

2. Antecedentes

2.1 Proyectos Terminales

Sistema de recuperación de información semántico [1]

En este proyecto se explora y aplican técnicas del Procesamiento del Lenguaje Natural para la recuperación de la información.

En este se utilizaron cuatro módulos: léxico, sintáctico, semántico y visualización. La diferencia será que se ocupará un etiquetado morfológico antes de pasar por los cuatro módulos mencionados.

Otra diferencia es que en este proyecto el análisis de textos es muy ligero. La información extraída es: Autor, Titulo, Filiación, Keywords y Abstract. Y en el proyecto propuesto se busca extraer: la idea, la aportación general, el propósito y el resultado en publicaciones científicas.

Sistema de procesamiento de textos de investigación [2]

En este proyecto se procesan artículos de investigación escritos en inglés con un formato establecido por la IEEE. Y extrae información relevante en el artículo científico como: nombres de autores, título de la publicación, fecha de publicación, correo electrónico, institución, palabras claves, resumen. Por lo que este proyecto también se limita a hacer un análisis de texto ligero.

Otra diferencia es que este proyecto se implementó en un sistema con interfaz gráfica de manera local y el proyecto propuesto se realizará una aplicación web para la implementación del sistema.

Sistema clasificador de documentos de proyectos terminales usando el concepto de memoria asociativa [3]

En este proyecto se clasifican los documentos utilizando la búsqueda de palabras claves para después, para después realizar un análisis estadístico utilizando una red neuronal.

En el proyecto propuesto el análisis será utilizando con técnicas de procesamiento de lenguaje natural. Por lo que como resultado se tendrá un mayor tiempo en el de análisis, pero también mayores resultados.

2.2 Tesis

Herramientas de extracción de información para el español acoplables a GATE [4]

En esta tesis se utilizó técnicas del leguaje natural para la creación dos plugins especialmente desarrollados para GATE.

TBL Tools cuenta con conjunto de herramientas para construir de forma automática gramáticas o reglas para encontrar expresiones importantes.

Spanish cuenta con un tokenizador, un segmetador de oraciones, un etiquetador semántico, un etiquetador morfosintáctico y un reconocedor de entidades nombradas.

En el proyecto propuesto realizara reglas propias para poder extraer la información relevante del artículo científico y se realizara un etiquetado morfosintáctico.

2.3 Artículos de investigación

Keyphrase Extraction in Scientific Publications [5]

En este trabajo se presenta un algoritmo de extracción de frases clave para publicaciones científicas. Introduce características que capturan las posiciones de las frases en el documento con respecto a las secciones lógicas que se encuentran en científica discurso.

2.4 Software

ReVerb

Reverb es un programa que automáticamente identifica y extrae relaciones binarias de oraciones en inglés. ReVerb está diseñado para la extracción de información de escala Web, donde las relaciones de destino no se pueden especificar con antelación y la velocidad es importante. Su código es libre bajo una licencia académica.

3. Justificación

La búsqueda de sistemas inteligentes que exhiban características que se asocien con la inteligencia humana es un tema actual. Una de estas características es entender el lenguaje natural, procesar información y no las letras solo como caracteres.

En este mundo que falta por explorar en este tema es valioso contar con esquema que te permita, contar, agrupar, buscar y procesar información. Parece sencillo tener contar con un programa que pueda brindar un resultado, en la práctica eso resulta una suma de esfuerzos para dar un resultado en específico y sobre todo que cuente con el resultado esperado.

4. Objetivo

Diseñar e implementar un sistema para la extracción automática de información relevante en publicaciones científicas en inglés mediante técnicas de Procesamiento de Lenguaje Natural.

4.1 Objetivos específicos

- Extraer información el corpus para la implementación de patrones textuales.
- Extraer patrones que cumplan con el reconociendo de TASK, PROCESS y MATERIAL
- Implementación de patrones para la extracción se información relevante.

5. Marco Teórico

En esta sección se presenta un marco teórico que facilite la compresión de los conceptos relacionados con este proyecto

5.1 Expresiones regulares

Una expresión regular es un patrón que puede estar formado por un conjunto de caracteres (letras, números o signos) y por un conjunto de metacaracteres que representan otros caracteres o que indican la forma de combinar los caracteres y se emplea para compararlo con un grupo de caracteres. Las expresiones regulares se pueden emplear en: Comandos de sistemas operativos en Linux, editores de texto, lenguajes de programación, de forma nativa como JavaScript, PHP, Perl o a través de librerías como Java o .NET.

Los metacaracteres reciben este nombre porque no se representan a ellos mismos, sino que son interpretados de una manera especial, los usados son:

- . Representa cualquier carácter
- * El patrón que lo precede se repite 0 o más veces.
- ? El patrón se repite 0 o 1 vez. El patrón se repite 0 o 1 vez.
- + El patrón se repite 1 o más veces
- ^ Sirve para indicar que el patrón que lo acompaña esta al principio de la cadena
- \$ Indica que el patrón esta al final de una cadena
- | Sirve para alternar expresiones
- [] Permiten especificar el rango de caracteres válidos a comparar
- () Permite agrupar expresiones regulares.
- \ Para escribir delante de caracteres especiales

A continuación, se presentan algunos ejemplos del uso de expresiones regulares.

Ejemplo general

Notepad

Puede utilizar una expresión regular para verificar que la palabra "Notepad" aparece en el mensaje de cabecera. Este patrón necesita la palabra "Notepad" en cualquier ubicación del valor. Si texto es "Report.txt - Notepad", el patrón coincidirá porque contiene la serie "Notepad".

Distinción entre mayúsculas y minúsculas

(c/C)liente

Este patrón que contiene la palabra "cliente", con la "C" en mayúsculas y minúsculas coincidirá con ella.

Cualquier carácter único

método.pago

Utilice el carácter "." para indicar cualquier carácter único en la serie. Además de las letras y otros caracteres legales, este carácter puede ser un espacio o un número. En este caso, "método pago" y "método0pago" coincidirán.

Cero o más caracteres de repetición

*to*Ibar*

Utilice el carácter "*" para indicar cualquier número de caracteres previos o para indicar cero caracteres. En este ejemplo, coincidirá con "tlbar", "tolbar", "toolbar" y "toooolbar". Uno o más caracteres de repetición

to+Ibar

Utilice el carácter "+" para indicar un número de caracteres previo. La diferencia entre este carácter y "*" es que debe tener al menos uno de los caracteres con "+". Por eso, "tlbar" no coincidirá con este patrón, pero "tolbar", "toolbar" y "toooolbar" lo harán.

Cero o un carácter de repetición

to?Ibar

Este patrón quiere decir que o ningún carácter o uno de los símbolos anteriores coincidirá. Sólo dos series coincidirán con esta sintaxis: "tlbar" y "tolbar".

Comodín

*Pedido.*Cliente*

Utilice los caracteres "." y "*" para realizar comparaciones con comodín. Este patrón permite que se muestre cualquier número de cualquier carácter. Por ejemplo, si una aplicación inserta un espacio entre dos palabras en esta propiedad, esta sintaxis cubre ambos casos.

Cualquier carácter uno de un conjunto

Formulario[ABC]

Este patrón obtiene coincidencias de la palabra "Formulario" seguida de cualquiera de los caracteres incluidos entre corchetes. Puede utilizar esta expresión regular para que coincidan estas series: "FormularioA", "FormularioB" o "FormularioC".

Cualquier número de caracteres de un conjunto

*Formulario[ABC]**

Significa que la palabra "Formulario" seguida de cualquier número de caracteres de los que aparece entre corchetes coincidirá con esta expresión regular. Los ejemplos anteriores aún coincidirían: "FormularioA", "FormularioB" o "FormularioC". Además, coincidirían formas con un número de un carácter, como "FormularioAA" o "FormularioCCC", e igualmente coincidiría sólo con "Formulario".

Cualquier carácter uno que no esté en el conjunto

Formulario[^BE]

Esta sintaxis coincide con la palabra "Formulario" seguida de cualquier carácter, excepto "B" o "E". Por ejemplo, "FormularioA", "FormularioC" y "FormularioG" coincidirán, pero no lo harán "FormularioB" o "FormularioE".

Conjunto alfanumérico

Formulario[A-G]

Se puede especificar un intervalo de letras contiguas. En esta sintaxis, coincidirán "FormularioA", "FormularioB", "FormularioC", "FormularioD", "FormularioE",

"FormularioF" y "FormularioG", pero no lo harán "FormularioH" o "FormularioM". El intervalo alfanumérico distingue entre mayúsculas y minúsculas. "Formularioa" no dará ninguna coincidencia. Utilice esta sintaxis para que coincidan letras mayúsculas y minúsculas en este intervalo: "Formulario[a-gA-G]". Para que coincida con cualquier letra del alfabeto estándar, utilice todos los intervalos en mayúsculas y minúsculas: "Formulario[a-zA-Z]".

Expresión de grupo

Mi cometa (lila/azul/verde)

Utilice una expresión de grupo para operar en todos los elementos de un grupo. Por ejemplo, para aplicar un operador a un grupo o para buscar una serie específica antes o después de cada miembro del grupo, puede utilizar una expresión de grupo. Los paréntesis son el operador del grupo y se utiliza el carácter "|" para separar los elementos. En este ejemplo, "Mi cometa lila", "Mi cometa azul" y "Mi cometa verde" coincidirán con la expresión. Pero "Mi cometa roja" o "Mi cometa" no coincidirán con ella.

5.2 Extracción de información

La humanidad ha guardado su conocimiento comunicando de persona a persona, esta comunicación no solo ha sido oral y no también escrita. Es por esto que el conocimiento se encuentra almacenado utilizando un lenguaje natural, como lo es, el inglés o el español.

La Lingüística Computacional combina el conocimiento sobre la computación y el conocimiento matemáticamente preciso sobre la estructura del lenguaje humano, esta ciencia se encarga de todos los aspectos de la interacción de las computadoras y el lenguaje humano. La tarea final de esta ciencia es la construcción de una máquina que hable y entienda como nosotros lo hacemos.

La gran cantidad de textos existentes en formato electrónico en los últimos tiempos, hace imposible que una persona pueda leer, comprender y sintetizar toda la información contenida en ellos, es por esto que lograr que una máquina entienda como nosotros es importante.

La Extracción de Información encuentra y extrae información que satisfaga las necesidades de información de un usuario. Desde la perspectiva del Procesamiento del Lenguaje Natural los sistemas de Extracción de Información deben trabajar en distintos niveles, desde el reconocimiento de palabras hasta el análisis de oraciones y desde el entendimiento a nivel de oración hasta el análisis del texto completo, utilizando método y algoritmos que identifiquen o localicen ciertos elementos en el texto.

5.3 Patrones textuales

Los patrones textuales representan los diferentes tipos de conexiones lógicas entre las ideas importantes y las menos importantes de un texto, están diseñados para ayudarte a

reconocer y usar las estructuras de los textos con el fin de comprender y recordar mejor la información que obtuviste.

Está estrategia consiste, en identificar la estructura lógica con la cual el autor de un texto unió sus ideas en un todo coherente. Esta estructura puede variar de un texto a otro, ya que depende del tipo de texto y tema de este.

Patrón de texto descriptivo, se pueden utilizar palabras como: comenzando con, consta de, también, se conoce como, de; proporciona información acerca de un concepto, idea, tema, evento, objeto, persona, etc. y conecta ideas a través de descripciones, tomando en cuenta las características importantes del tema. Comúnmente se encuentran en los libros de texto.

Patrón de texto secuencia, se puede utilizar en palabras como: en, no había pasado mucho tiempo, ahora, eventualmente, antes, después, cuando, posteriormente, primero, luego, entonces, finalmente; presenta los hechos, datos, o conceptos en orden, señala los pasos o etapas del proceso.

Patrón de texto de comparación y contraste, se puede utilizar en palabras como: de cualquier modo, tal como, por otro lado, por el contrario, no sólo, sino, similar a, mientras, igual que, todavía, etc., resalta las diferencias y similitudes entre hechos, personas, conceptos, etc.

Patrón de texto causa y efecto, se puede utilizar en palabras como: porque, desde que, por lo tanto, consecuentemente, como resultado de, esto nos lleva a..., de manera que, sin embargo, de acuerdo a, si...entonces, muestra la relación casual, entre un acto y sus consecuencias, en él se señala como los hechos o conceptos son resultado de alguna acción o evento anteriormente suscitado.

Patrón de texto solución de problemas: Presenta un problema y el proceso para obtener la solución del mismo.

A continuación, se presentan un ejemplo de patrones textuales.

porque las funcionalidades son...

porque permiten el...

porque debido a su...

Significa que la palabra porque es un patrón textual que expresa la causa, motivo, razón

5.4 Definición de Tarea, Proceso, Material.

La investigación científica y la práctica se basan en obtener, mantener y comprender el cuerpo del trabajo científico existente en áreas específicas relacionadas con ciertos objetos fundamentales.

Estos objetos fundamentales son en los trabajos científicos: TASK, PROCESS, y MATERIAL.

TASK son las frases clave que indican el problema, el objetivo final, la aplicación, la tarea.

PROCESS son las frases clave relacionadas con algún modelo, algoritmo o proceso científico.

MATERIAL son las palabras clave que identifican los recursos utilizados en el documento.

A continuación, se presentan varios ejemplos para cada objeto fundamental.

Ejemplos de TASK

- *administrative system*
- *atmospheric modelling*
- *boundary element method*
- *casting process simulations*
- *chemical reaction*
- *deformed Lagrangian*
- *level set equation*

Ejemplos de PROCESS

- *oxidation*
- *observed dynamics*
- *Observations*
- *notion of renormalisation*
- *modifying the current density*
- *Looking for glueballs*
- *irreversible energy loss*

Ejemplos de MATERIAL

- *alloys*
- *aluminium*
- *catalysts*
- *chirp*
- *chloroform*
- *cluster*
- *compact stars*

6. Desarrollo del proyecto

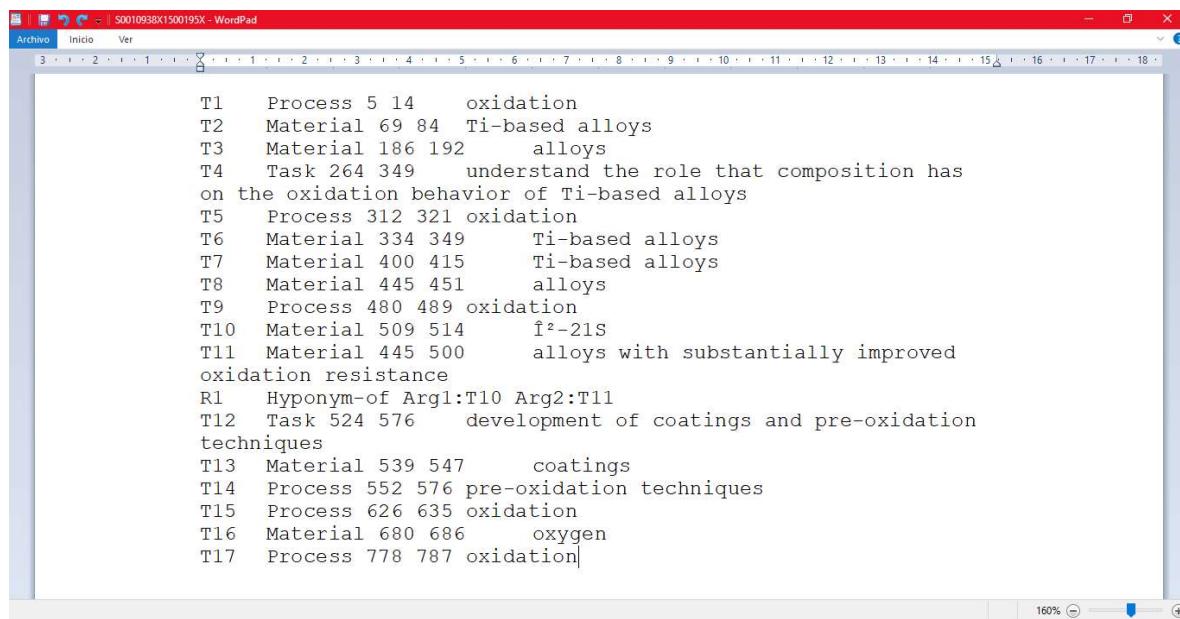

En esta sección se presenta una descripción del proceso para realizar este proyecto.

6.1 Descripción del conjunto de datos

Utilizando un corpus que se basa en las publicaciones de acceso abierto de ScienceDirect y que consiste en 500 fragmentos de artículos de revistas distribuidos uniformemente entre los dominios Informática, Ciencias de los materiales y Física.

Se proporcionan tres tipos de archivos: archivos .txt sin formato con párrafos muestreados, archivos .ann con anotaciones para esos párrafos y documentos .xml con el texto completo del artículo original. La parte de datos de capacitación del corpus consta de 350 documentos, 50 se guardan para el desarrollo y 100 para las pruebas.

En la figura 1 se presenta el formato que tienen los archivos .ann, en el caso para TASK, PROCESS y MATERIAL observa como la primera parte corresponde a un identificador, en segundo por el tipo de este, en tercero la posición donde inicia en el archivo .txt, en cuarta la posición final de la frase y en quinto el contenido. Cualquier otra línea que no contenga TASK, PROCESS o MATERIAL, no la consideraremos.

The screenshot shows a Windows WordPad application window titled "50010938X1500195X - WordPad". The menu bar includes "Archivo", "Inicio", and "Ver". The status bar at the bottom right shows "160%". The main text area contains the following content:

```
T1 Process 5 14 oxidation
T2 Material 69 84 Ti-based alloys
T3 Material 186 192 alloys
T4 Task 264 349 understand the role that composition has
on the oxidation behavior of Ti-based alloys
T5 Process 312 321 oxidation

T15 Process 626 635 oxidation
T16 Material 680 686 oxygen
T17 Process 778 787 oxidation|
```

Figura 1. Estructura de archivo .ANN

En la figura 2 se presenta la forma que tienen los archivos .txt, que son archivos de texto sin formato. Se resalta en la imagen en donde se encuentran los TASK, PROCESS y MATERIAL, que corresponden al archivo .ann de la figura 1.

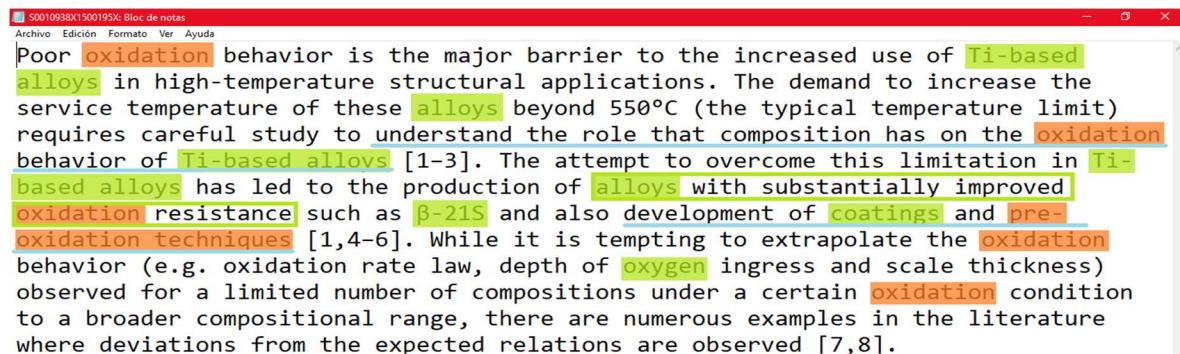

Figura 2. Estructura de archivo .TXT

6.2 Procesamiento de los archivos

En esta fase se procede a extraer el contenido que es encuentran al lado izquierdo y derecho de los TASK, PROCESS y MATERIAL de todos los archivos, utilizando la posición que se indica en archivo .txt.

En la figura 3 se presenta la apertura de ambos archivos (txt y ann), con el código '10.1.1 Fragmento de código para apertura de archivo'. Para la apertura de todos los archivos utilizamos el código '10.1.2 Fragmento de código para la apertura de todos los archivos con extensión txt y ann.

```

```

Figura 3. Apertura de archivos txt y ann

Después, el sistema procede a extraer el texto que es encuentran al lado izquierdo y derecho de todos los TASK, PROCESS y MATERIAL de todos los archivos. Para esto se debe procesar línea por línea de los archivos ann.

En la figura 4 se presenta un ejemplo de cómo se procesa cada línea en el archivo ann.

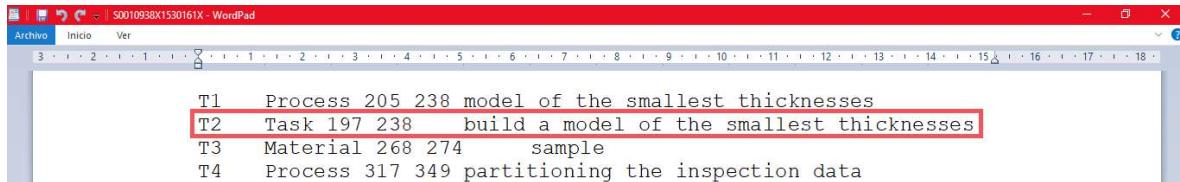

Figura 4. Procesamiento de líneas, archivo ann

En la figura 6 se presenta la parte que se encuentra a la izquierda y la parte que se encuentra a la derecha, del ejemplo de la figura 5. Estas partes se guardan para su posterior procesamiento. Se guarda todo lo que está a la izquierda hasta el inicio del texto, y todo lo que está a la derecha hasta el final del archivo, porque el TASK, PROCESS y MATERIAL se pueden encontrar en cualquier parte del texto. Así no aseguramos de guardar todo el contenido sin importar si es una palabra o cien.

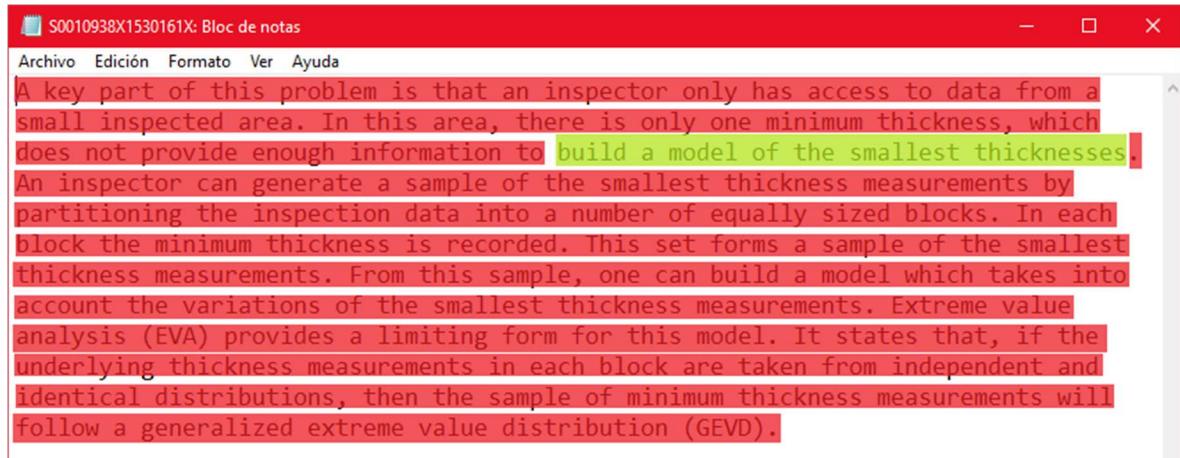

Figura 5. Parte izquierda y derecha de ejemplo

En la figura 6 se observa que el identificador para TASK, PROCESS y MATERIAL, siempre comienza con “T”.

Por esto se utiliza el código ‘10.1.3 Fragmento de código para identificación de TASK, PROCESS y MATERIAL’ para localizar que líneas el archivo ann comienza con ‘T’ y después buscar si contiene la palabra Task, Process o Material, para identificar cada tipo.

```

T1 Process 205 238 model of the smallest thicknesses
T2 Task 197 238 build a model of the smallest thicknesses
T3 Material 268 274 sample
T4 Process 317 349 partitioning the inspection data
T5 Material 334 349 inspection data
T6 Material 367 387 equally sized blocks
T7 Material 397 402 block
T8 Material 455 461 sample
T9 Process 536 620 model which takes into account the
variations of the smallest thickness measurements
T10 Process 622 644 Extreme value analysis
T11 Process 646 649 EVA
* Synonym-of T10 T11
T12 Process 883 921 generalized extreme value distribution
T13 Process 923 927 GEVD
* Synonym-of T12 T13

```

Figura 6. Identificador para TASK, PROCESS y MATERIAL

Después, el sistema procede a guardar la parte izquierda y derecha con el código '10.1.4 Fragmento de código para guardar parte izquierda' y '10.1.5 Fragmento de código para guardar parte derecha'. Y reducimos las palabras que queremos guardar con la variable int CantEspacios, dándole el valor del número de palabras que queremos guardar. En este caso utilizamos CantEspacios=10.

En la figura 7 se presenta el resultado de guardar 10 palabras.

```

50010938X1530161X.ann
Número de Lineas =15
Process = model of the smallest thicknesses
Izq = thickness, which does not provide enough information to build a
Der = . An inspector can generate a sample of the smallest
Task = build a model of the smallest thicknesses
Izq = one minimum thickness, which does not provide enough information to
Der = . An inspector can generate a sample of the smallest
Material = sample
Izq = model of the smallest thicknesses. An inspector can generate a
Der = of the smallest thickness measurements by partitioning the inspection data
Process = partitioning the inspection data
Izq = can generate a sample of the smallest thickness measurements by
Der = into a number of equally sized blocks. In each block
Material = inspection data
Izq = a sample of the smallest thickness measurements by partitioning the
Der = into a number of equally sized blocks. In each block
Material = equally sized blocks
Izq = measurements by partitioning the inspection data into a number of
Der = . In each block the minimum thickness is recorded. This
Material = block

```

Figura 7. Resultado de guardar 10 palabras

Realizando esto a los 350 archivos de entrenamiento o “train” utilizando los 350 archivos .ann y sus .txt correspondientes.

Como se presenta en la figura 8 se procesan todos los archivos sin ningún error.

```
*****
Numero de Archivo 350
Numero de Lineas =16
S2352179114200056.ann
Numero de Lineas =16
Process = fusion reactors
Izq = viability of any future fusion power plant concept. Heat in
Der = must be extracted through a wall and cannot be exhausted
Process = fusion reactors
Izq = be exhausted volumetrically, which limits the allowed power density in
Der = [1] and is a severe technical challenge in itself [2].
Process = static surfaces
Izq = in the heat exhaust capabilities of existing designs [3] and
Der = can suffer severely from erosion due to impinging plasma particles
Material = Power and particle exhaust
Izq =
Der = are crucial for the viability of any future fusion power
Process = neutron irradiation
Izq = in itself [2]. In addition, structural material changes resulting from
Der = cause degradation in the heat exhaust capabilities of existing designs
Task = plasma facing components
```

Figura 8. Procesamiento de archivos de entrenamiento

Y se guarda el resultado en un archivo de texto, en este formato:

IDENTIFICADOR (Task, Process o Material) + Tabulador + CONTENIDO + Tabulador + PARTEIZQUIERA + Tabulador + PARTEDERECHA. Con el código de ‘10.1.6 Fragmento de código para guardarle parte izquierda y derecha en un archivo’

En la figura 9 se presenta la visualización del resultado en un archivo de texto. En este formato resulta difícil tratar de encontrar algún patrón textual. Por lo que se procede a visualizarlo de otra manera, para un mejor y más rápido procedimiento.

Resultado: Bloc de notas

Archivo Edición Formato Ver Ayuda

Process quantum shell effects features do not matter anymore. But for less violent scenarios, cannot be ignored.

Process semi classical treatment of dynamical correlations develop improved molecular dynamics methods combining quantum features with a [17,18]. Still, no clear-cut quantum approach is readily available

Process quantum approach semi classical treatment of dynamical correlations [17,18]. Still, no clear-cut is readily available yet, in spite of numerous formal attempts

6.3 Reconocimiento de patrones

En esta sección se procede al reconocimiento de patrones ocupando el archivo guardado anteriormente con la parte izquierda y derecha.

En la figura 10 se muestran los pasos para abrir el archivo txt por medio de Excel para una mejor visualización.

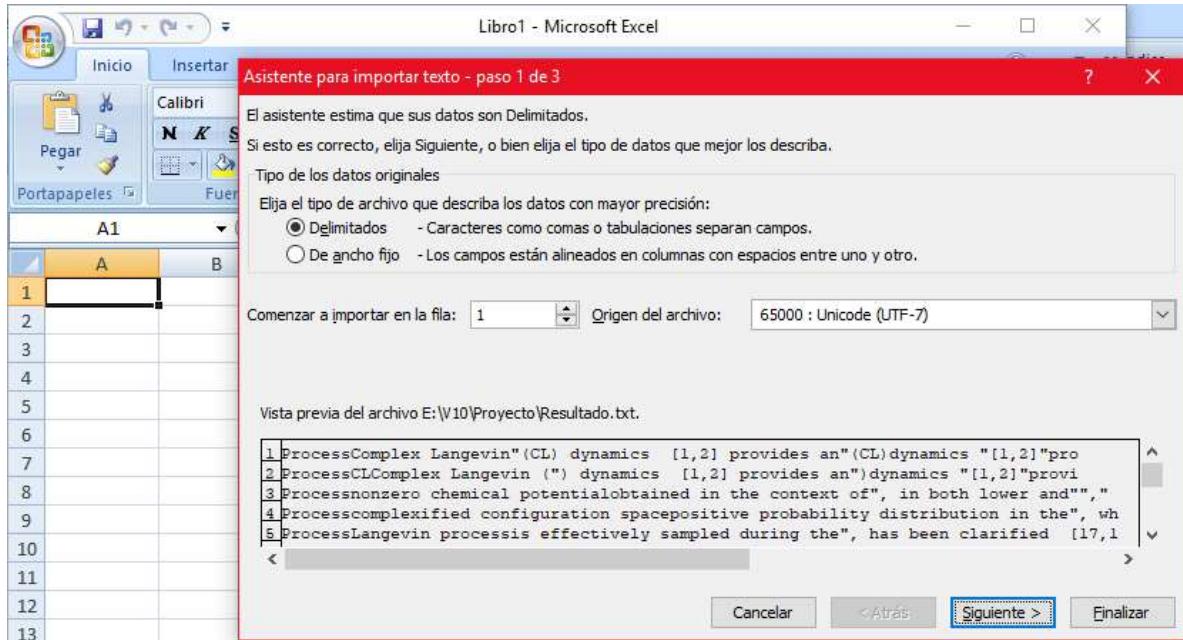

Figura 10. Paso 1 Abrir en Excel

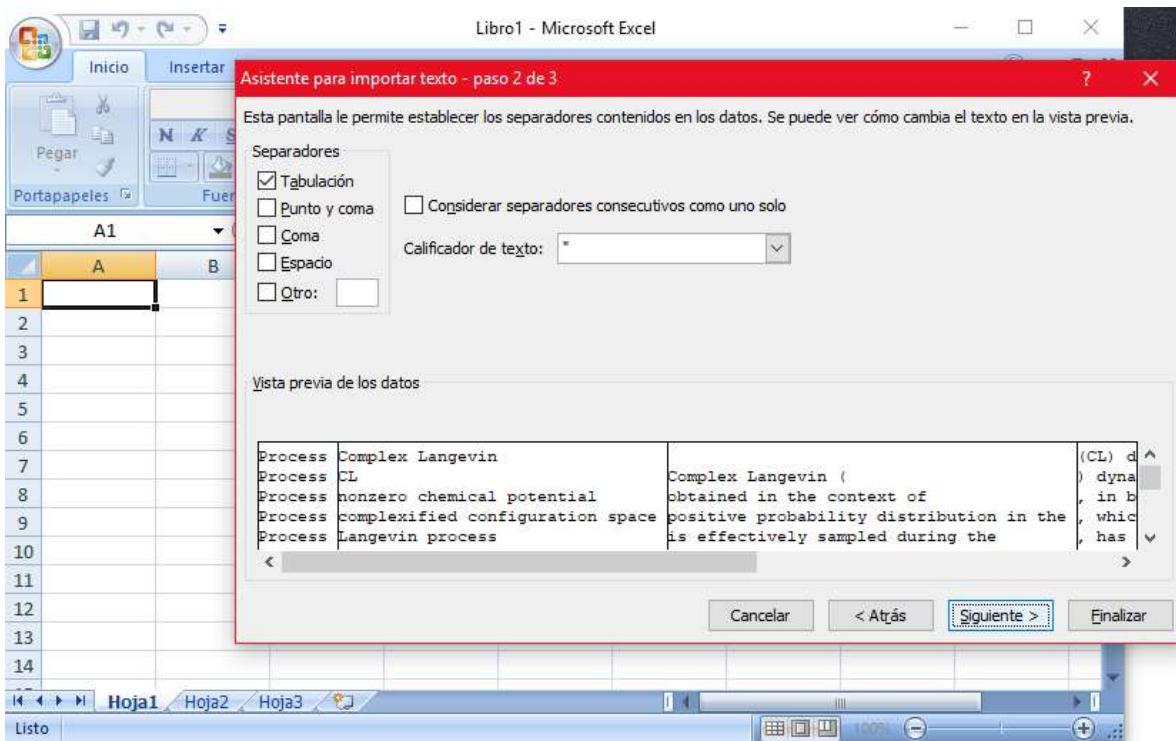

Figura 11. Paso 2 Abrir en Excel

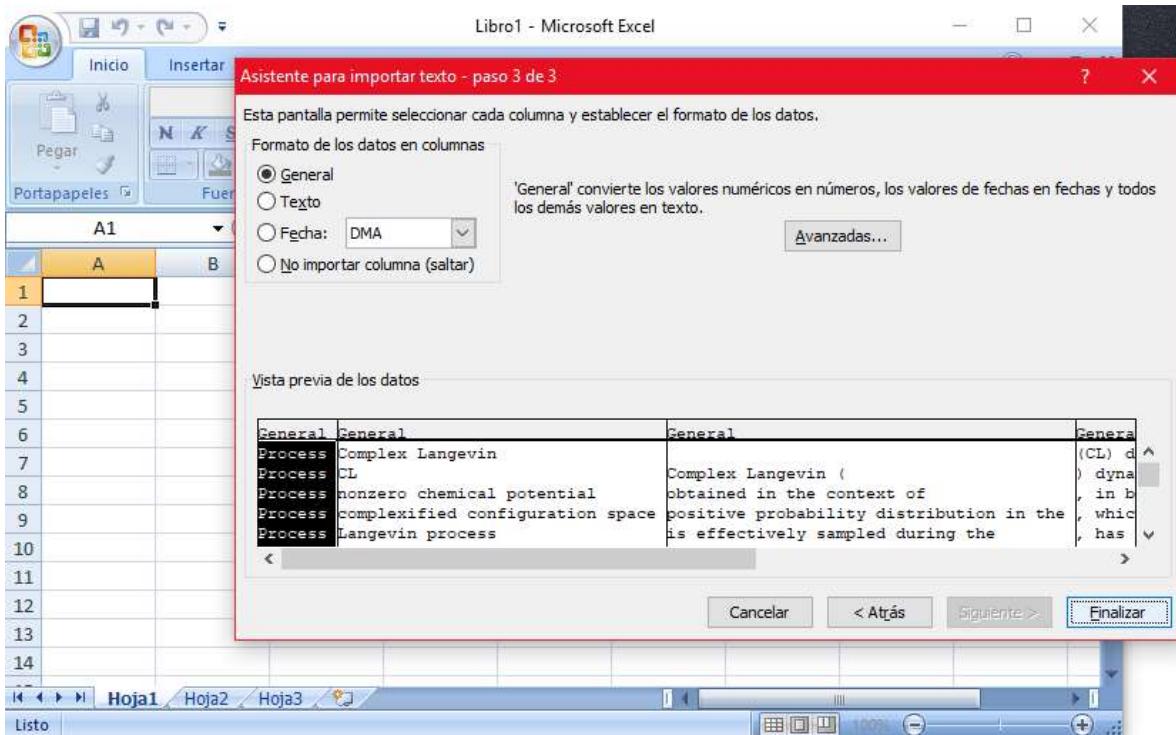

Figura 12. Paso 3 Abrir en Excel

De esta forma podemos abrir el archivo en una tabla de Excel, para un mejor procesamiento para la identificación de patrones. Como se presenta en la figura 13.

Figura 13. Visualización en Excel - 10 palabras

En la figura 14 se presenta la separación de los TASK, PROCESS y MATERIAL unos de los otros.

Figura 14. Separación Task, Process, Material

A pesar de tener una mejor visualización resulta difícil encontrar algún tipo patrón al utilizar 10 palabras.

Por lo que realiza el mismo proceso, pero para obtener 5, 4, 3, 2, 1, palabras a la izquierda y derecha del TASK, PROCESS y MATERIAL. Para lo cual solo cambiamos el valor de la variable CantEspacios=5, 4, 3, 2, 1.

La figura 15 muestra el resultado de 5 palabras visualizado en Excel. Y la figura 16 muestra la visualización en Excel de una palabra.

Figura 16. Visualización 1 palabra

De esta forma podemos reconocer que hay palabras que se repiten y por lo cual es posible obtener un patrón para el reconocimiento de estas.

Examinando las palabras y frases encontradas, se observa que es más beneficioso procesar el lado izquierdo y derecho por separado y además de integran todas las frases encontradas con 5, 4, 3, 2, 1, pero dividiéndolas respectivamente por el tipo (TASK, PROCESS, MATERIAL) como resultado obtenemos 6 conjuntos de elementos en total, 2 por cada tipo: Task-Izquierda, Task-Derecha, Process-Izquierdo, Process-Derecho, Material-Izquierdo, Material-Derecho.

Copiendo en otra columna todas la frases y eliminando los duplicados, contabilizamos las veces que se repite cada uno de estas y así identificar cuáles son las que se repiten mas.

La figura 17 presenta la contabilización de las palabras y/o frases que se repiten más.

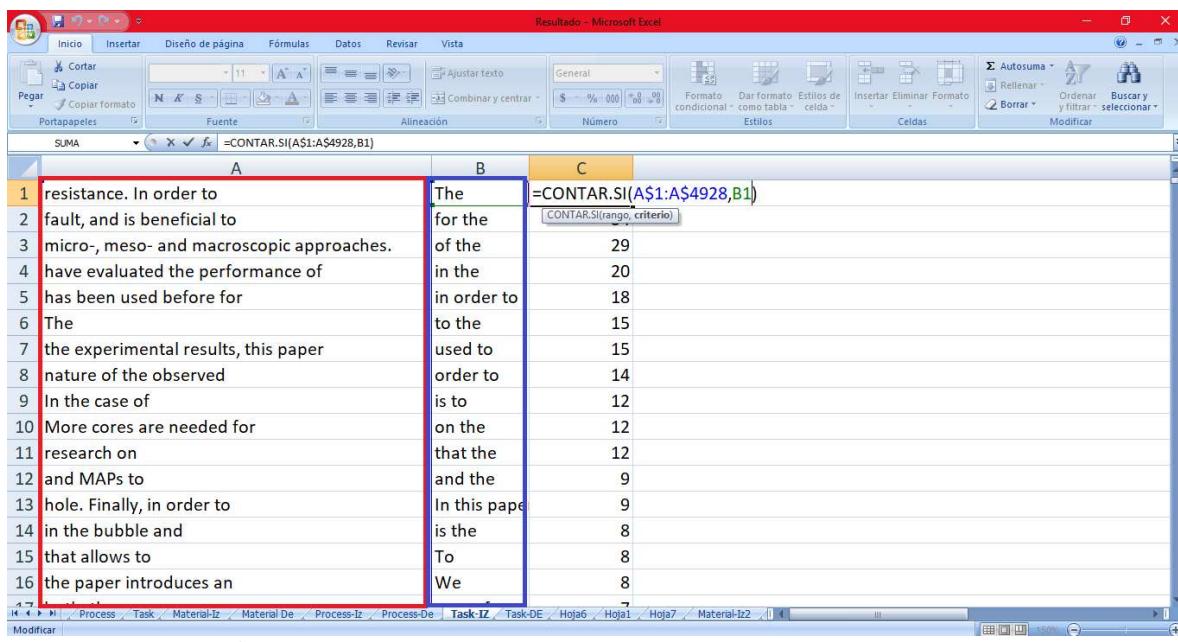

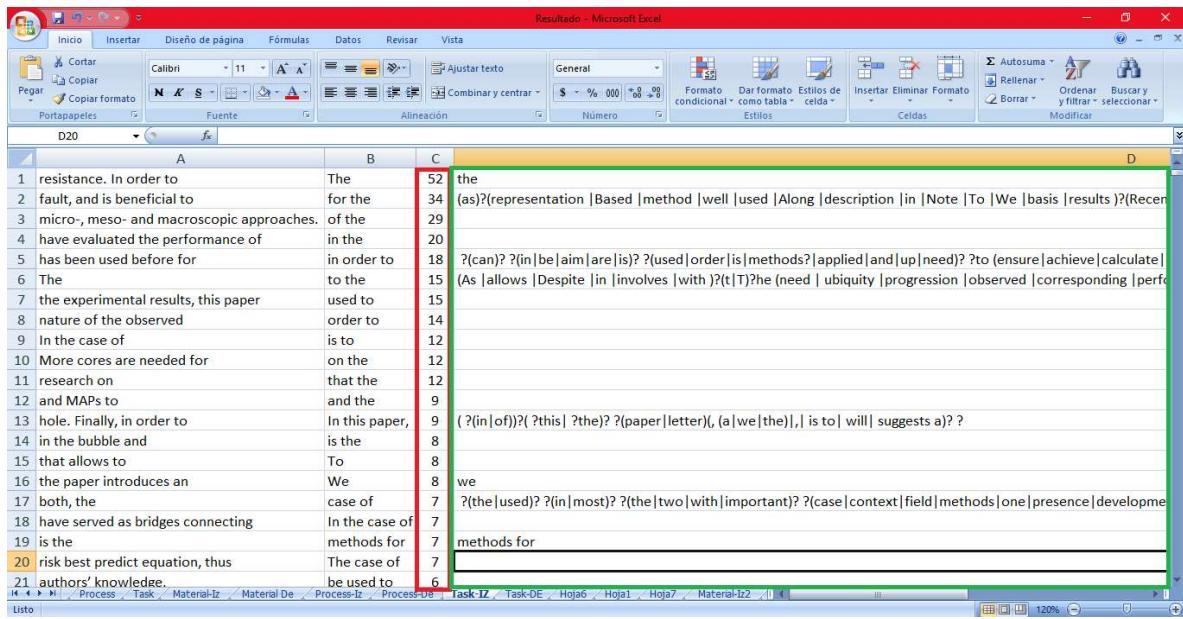

Figura 17. Frases repetidas

Se utilizan las que se repiten más para formar patrones con estas frases. En estas frases hay palabras que se tienen en común, por lo cual se tendrá un solo patrón para varias frases que se repiten y no un patrón por cada frase.

En la figura 18 y 19 se observa los patrones encontrados de acuerdo a la frase que se repite.

Figura 19. Patrones encontrados 2

Este proceso se realizó para los 6 conjuntos de elementos mencionados anteriormente, si bien fue posible elaborar patrones en expresiones regulares que reconozcan TASK, PROCESS y MATERIAL, en estos hay similitudes por lo que, si se podrán reconocer, pero no en todos los casos se podrán diferenciar de que tipo son.

Por lo tanto se procede a buscar más patrones pero una otro enfoque.

Se extrae un máximo de 5 palabras para la parte derecha, pero separando estas palabras por un tabulador para facilitar su procesamiento.

La figura 20 Presenta el resultado visualizado en Excel.

Figura 20. Visualización 5 palabras segunda parte

Haciendo una búsqueda de las palabras que más se repiten se encuentra que una de estas es la palabra “the”. Esta se utilizará para formar un patrón por cada tipo.

Se comienza por separar los TASK de los PROCESS Y MATERIAL, después por tener 5 copias de las 5 palabras y cada una de esas copias estará ordenada de diferente manera, la primera estará ordenada por la primera palabra, la segunda copia estará ordenada por la segunda palabra y así sucesivamente.

Después se copia la palabras que se encuentran en la segunda columna de acuerdo a la columna de ordenamiento, las palabras que se copiarán serán de acuerdo a una sola palabra en este caso a “the”.

La figura 21 ilustra este tipo de ordenamiento, las palabras de la primera copia que están de color azul, están ordenadas por la columna A, la segunda copia ordenadas por la columna H, y la tercera por la columna O.

Figura 21. Ordenamiento por palabras

Las palabras se copiaran en una nueva hoja, en la columna A para TASK, en la columna D para PROCESS y en la columna G para MATERIAL. En estas 3 columnas se eliminan los duplicados. Después se busca cuáles de las palabras de la columna A se repiten en la D y G, cuáles de la columna D se repiten en A y G, y cuáles de la columna G se repiten en A y D, esto se representa en la figura 22.

Figura 24. Ejemplo de una expresión regular para un patrón encontrado

Este mismo proceso lo realizamos para otras palabras que se repitan en el conjunto de 5 palabras que se extrajo al principio del proceso, y así obtienen patrones que sean exclusivos para cada uno de los diferentes tipos.

6.4 Patrones finales

Se identificaron un total de 194 patrones. La lista completa de estos patrones se encuentra en el Apéndice II.

Tipo	TASK	PROCESS	MATERIAL
Cantidad	21	81	92

Tabla 1. Primera tabla de patrones

En la figura 25, 26 y 27, se presentan solo un ejemplo de una expresión regular formada por un patrón, para cada tipo.

6.5 Extracción utilizando patrones reconocidos

En esta sección se aplicaron una combinación de los patrones obtenidos en las tablas 1 y 2, para el reconocimiento en 50 archivos de prueba.

En la figura 20 se aprecian las líneas procesadas, las interacciones, una a una y si encuentra un patrón que reconoce a un task, process, material o que no puede distinguir a cual pertenece.

The screenshot shows the NetBeans IDE interface with the title bar "PTPrueba - NetBeans IDE 8.2". The menu bar includes "Archi", "Edit", "View", "Navegador", "Source", "Reestructurar", "Ejecutar", "Depurador", "Proyecto", "Teclado", "Herramientas", "Venta", "Ayuda". The toolbar includes icons for file operations like New, Open, Save, and Run. The left sidebar shows "Archivos" (Archives), "Prestaciones" (Features), and "Proyectos" (Projects). The main window displays the "Salida" (Output) tab with the following text:

```

Tabla 3. Task, Process y Material reconocidos con los patrones

En la tabla 4 se muestra el total de elementos identificados y no identificados.

	Task	Process	Material	Relacion	Total
Original	137	458	567	168	1330
Identificado	128	272	369	168	937
No identificado	9	186	198	0	393

Tabla 4. Resultado totales

En la tabla 5 se muestran los porcentajes de los elementos identificados

%	Task	Process	Material	Relacion	Total
Identificado	93.43%	59.39%	65.08%	100.00%	70.45%
No identificado	6.57%	40.61%	34.92%	0.00%	29.55%

Tabla 5. Porcentaje de resultados

Los resultados obtenidos, muestran un reconocimiento satisfactorio, en especial en el reconocimiento con patrones para TASK, que se encontró cerca del reconocer el total. Aun que con los patrones correspondientes para PROCESS y MATERIAL no se obtuvo el mismo resultado que para los patrones de TASK, no quiere decir que se obtuviera un mal resultado, ya que con los patrones obtenidos para estos se reconoció más de la mitad del total de cada uno.

También se observó que para TASK se encontró un menor número de patrones. Y estos patrones son menos extensos que los de PROCESS y MATERIAL.

Lo cual nos indica que es más fácil localizar el objetivo principal de un texto que encontrar los procesos de los que se habla en el texto así como los materiales involucrados en estos.

8. Conclusiones

En este proyecto se realizó un sistema para el reconocimiento de información relevante en publicaciones científicas en inglés, por medio de la extracción del contexto izquierdo y derecho de objetos fundamentales. Esta extracción se realiza a partir de un corpus compuesto por fragmentos de artículos científicos, los cuales se procesaron para la obtención de patrones. Estos se implementaron utilizando expresiones regulares con la finalidad de reconocer la información relevante. Esto se realizó para crear sistemas inteligentes que entienda el lenguaje natural y facilitar el procesamiento de una gran cantidad de información de forma similar a como la procesa un ser humano.

Considerando los resultados obtenidos, podemos concluir que aplicando el lenguaje natural y patrones es posible la identificación de información relevante, como se pudo observar se pudo identificar con una mayor eficacia la información relacionada con el objetivo final de cada texto científico y aun cuando no se logró la misma eficacia para la identificación con la información relacionada con los modelos, algoritmos, procesos científicos, recursos que se encontraban en los textos científicos, se logró una respuesta que consideramos satisfactoria.
